

Study on Alzheimer's Disease and Related Dementia and Caregiver Experiences in the Community

Researchers at the University of New Hampshire are conducting an 18-month long research study focusing on people with Alzheimer's Disease and Related Dementia (ADRD) and their caregivers. The study aims to examine the changes to memory, physical health, performance of daily living activities and care burden over the 18-month period. The research team will collect data through observation of tasks through home visits and completion of survey questionnaires every two months during this time.

If you are the primary caregiver for a family member with mild to moderate ADRD who lives at home, you and your care recipient are eligible to participate in this study. Each participant dyad (caregiver and care recipient together) will receive monetary compensation of \$100 every two months on completion of the data and will receive \$900 in total for the study for the time and contribution to this study.

Please contact us if you are interested in taking part in this study
